

Lab 05 - Task Description

In this lab, you will build a simple **Inventory Management** desktop application using **JavaFX** and **SceneBuilder**. The application contains two screens that allow the user to add and manage products.

- **Screen 1 - Add Product:** The user enters a product name, product category, quantity, and price. Clicking the *Add Product Button* stores the information, and clicking *View Inventory* opens the second screen.
- **Screen 2 - Inventory List:** All added products are displayed in a table with five columns: Product Name, Category, Quantity, Price, and Action. Each row contains a *Delete* button that removes that specific product from the table. Newly added products should appear immediately without restarting the application. A *Back Button* should allow navigation back to Screen 1.

Application Preview

Inventory Management System

Register new laboratory assets into the central database with high precision and automated tracking.

PRODUCT NAME: e.g. Bunsen burner flask 250ml

PRODUCT CATEGORY: Select Category

QUANTITY: 1

PRICE (USD): \$ 100

If any of the field is empty then show a error message here.
